In the specification:

Please replace the last paragraph on page 5, beginning at line 22 with the following:

Also provided by the present invention are methods of diagnosis using stabilized glycoproteins, such as immunoglobulins, proteins and other bioactive molecules. In a specific embodiment, the invention provides a stabilized anti-respiratory syncytial virus (RSV) antibody useful to treat or prevent RSV infection, such as a stabilized form of SYNAGIS® (palivizumab) (see U.S. Patent No. 5,824,307 and Johnson et al., J. Infectious Disease 176:1215-1224, 1997, both of which are incorporated by reference in their entireties), and other anti-RSV antibodies, including variants of SYNAGIS® (see United States patent Application Serial No., 09/724,396, filed November 28, 2000, United States patent Application Serial No. 09/724,531, filed November 28, 2000, United States patent Application Serial No. 09/996,288 filed November 28, 2001, and United States patent Application Serial No. 09/996,265 filed November 28, 2001, all entitled "Methods of Administering/Dosing Anti-RSV Antibodies for Prophylaxis and Treatment," all by Young et al., all of which are incorporated by reference herein in their entireties, particularly the sequences of heavy and light chain variable domains and CDRs of anti-RSV antibodies disclosed therein). In a preferred embodiment, a stabilized anti-RSV antibody has one or more amino acid modifications in the heavy chain constant domain hinge region that renders the antibody less susceptible to degradation.
